

The reason you received a letter instructing you to test your backflow preventer is because your residence or commercial site has the potential to contaminate the drinking water supply system and a backflow prevention assembly has been installed on the private side of the water meter to isolate your system from the drinking water supply. Regulations require the device to be tested annually in order to maintain water service to the property. You can contract with any certified backflow tester on our approved tester list sent to you along with your notice. If you have any additional questions, please refer to our **Cross Connection and Backflow Prevention Policy** or contact our office at 334-206-1627.
